Throughout this manual, there are a number of HAZARD WARNINGS that must be read and adhered to in order to prevent possible personal injury and/or damage to equipment. Three signal words "DANGER", "WARNING", and "CAUTION" are used to indicate the severity of a hazard and are preceded by the safety alert symbol.

⚠️ DANGER
Indicates the most serious hazard and is used when serious injury or death WILL result from misuse or failure to follow specific instructions.

⚠️ WARNING
Used when serious injury or death MAY result from misuse or failure to follow specific instructions.

⚠️ CAUTION
Used when minor or moderate injury or product / equipment damage MAY result from misuse or failure to follow specific instructions.

NOTICE
Indicates information considered important, but not hazard-related.

It is the responsibility of all personnel involved in installation, operation and maintenance to fully understand the Danger, Warning, and Caution procedures by which hazards are to be avoided.

Models: TB, TBSH, TD, TUB, TUBSH, TUD
Twin City Fan & Blower Catalogs 4830 and 4850 provide additional information on this equipment. These catalogs can be found at www.tcf.com or by contacting your local Twin City Fan & Blower sales representative. Also see installation and maintenance manuals ES-191 and ES-404.

Introduction
DO NOT INSTALL, USE OR OPERATE THIS EQUIPMENT UNTIL THIS MANUAL HAS BEEN READ AND UNDERSTOOD. READ AND SAVE THESE INSTRUCTIONS FOR FUTURE USE.
The purpose of this manual is to aid in the proper installation and operation of fans supplied by Twin City Fan & Blower. These instructions are intended to supplement good general practices and are not intended to cover detailed instruction procedures because of the wide variety and types of fans manufactured by Twin City Fan & Blower.

It is the responsibility of the purchaser to assure that the installation and maintenance of this equipment is handled by qualified personnel experienced in such work and equipment.

Contact your local representative should you need further information.

Shipment and Receiving
Prior to shipment, all fans have been thoroughly inspected and tested.
All equipment shipped from Twin City Fan & Blower is boxed or crated to fully comply with trucking requirements. Inspect all shipments carefully for damage.
THE RECEIVER MUST NOTE ANY DAMAGE ON THE CARRIER’S BILL OF LADING AND FILE A CLAIM IMMEDIATELY WITH THE FREIGHT COMPANY IN THE CASE OF ANY DAMAGE. Keep a record of all equipment received including inspection details and date of receipt due to the possibility of partial shipments.
If you receive damaged goods, contact your sales or factory representative for repair or replacement service.

Handling
Handle your equipment with caution. Some fans are provided with lifting lugs or holes for easy handling. Others must be handled using nylon straps which protect the fan’s coating and housing. Spreader bars should be used when lifting large parts.
Fans should be lifted by using straps around the fan housing only. DO NOT LIFT FANS BY THE MOTOR, MOTOR BASE, PROP OR FLANGES.

Roof ventilators should be lifted by using straps around the fan housing or base only. Spreader bars should also be used to avoid damage to stack caps or hoods. DO NOT LIFT ROOF VENTILATORS BY THE STACK CAP OR HOOD. On hooded units, disassemble the stack from hood when lifting. Upblast models may be lifted assembled.

©2005 – 2018 Twin City Fan Companies, Ltd.
**Storage**

If fans are stored for any length of time, they should be stored in a clean, dry location to prevent rust and corrosion. Outdoor storage is not recommended. When outdoor storage is necessary, fans should be protected from the elements as completely as possible. Cover the fan inlet and outlet and keep motors dry and clean.

For extended storage (more than 3 months) motor shafts and bearings should be rotated monthly. If stored longer than 6 months, bearing grease in motor and fan should be purged and replaced with compatible grease. Belts should be rechecked for proper tension. Storage records should be kept to assure proper maintenance. The factory can advise warranty centers to provide motor and bearing service if needed.

**Installation**

Roof ventilators should always be mounted to a flat, level, solid and rigid structure. Particular caution should be exercised when installing fans on metal buildings. Be sure wall or roof is capable of supporting the fan(s). Fans mounted on walls or roofs and not supported correctly will cause vibration that could cause damage or injury.

Fans mounted off ground level should be rigidly mounted to a structural platform and be placed over or as near as possible to a solid wall or column.

Support for suspended fans must be cross-braced for live load support to prevent side sway.

Use guy wires to help secure roof units if excessively windy conditions prevail.

1. **CAUTION**

   This fan contains rotating parts and requires electrical service. Appropriate safety precautions should be taken during installation, operation and maintenance.

2. **WARNING**

   Do not install or operate this fan in an environment or atmosphere where combustible or flammable materials, gasses or fumes are present unless it was specifically designed and manufactured for use in that environment. Explosion or fire can result. Explosive, corrosive, high temperature, or other extreme conditions may require special construction, inspection and maintenance. It is necessary to observe the fan manufacturer’s recommendations and limitations concerning the type of material to be handled by the fan and its application to special conditions.

3. When the roof ventilator is designed to be mounted on a curb, the curb should be securely installed prior to fan installation.

4. A damper, if used, should be securely mounted within the curb or wall in a manner which allows free and unobstructed operation.

5. **CAUTION**

   All electrical work must be done in accordance with local and/or national electrical codes as applicable. If you are unfamiliar with methods of installing electrical wiring, secure the services of a qualified electrician.

6. **WARNING**

   This product must be grounded.

7. **WARNING**

   Make sure power is turned off and locked in the OFF position at the service entrance before installing, wiring or servicing the fan.

8. **CAUTION**

   Before wiring the motor, check the supply voltage against the motor nameplate voltage.

   High or low voltage can damage the motor and void the motor warranty. See Table 1.

9. On three-phase units check and calculate phase unbalance as follows:

   \[
   \% \text{Voltage Unbalance} = \frac{100 \times \text{max. voltage deviation from avg. voltage}}{\text{avg. voltage}}
   \]

   **How To Use The Formula:**
   
   With voltage of 220, 216 and 213
   
   a. Avg. Voltage = 220 + 216 + 213 = 649 ÷ 3 = 216
   
   b. Max. Voltage Deviation From Avg. Voltage = 220 – 216 = 4
   
   c. \% Voltage Unbalance = 100 x (4 ÷ 216) = 1.8%

   Voltage unbalance should not exceed 2%.
10. **WARNING**

   Be sure to keep all wiring clear of rotating or moving parts.

11. **WARNING**

   Before starting the fan, turn the wheel to assure it rotates freely. If needed, adjust the wheel/shaft/bearing/motor position as required to achieve necessary clearances.

12. On belt driven units, assure belts are tensioned and aligned properly. See Maintenance section, page 3.

## Check, Test & Start Procedure

**WARNING**

Electric shock hazard. Could cause severe injury or death. Failure to bond the frame of this equipment to the building electrical ground by use of the grounding terminal provided or other acceptable means may result in electrical shock. Disconnect electric power before servicing equipment. Service to be performed only by qualified personnel. Make sure power is turned off and locked in the OFF position.

1. Check to verify that the propeller is free to rotate.
2. Verify that supply voltage on the line side of disconnect agrees with voltage on fan data plate and is within the 10% utilization voltage.
3. Apply power to unit and check rotation of propeller with the directional arrow on the unit.

**WARNING**

Rotation is critical. If allowed to operate in the wrong direction, the motor will overload and burn out.

4. **Electrical Input Check:** Perform check of fan ampere draw and verify that motor nameplate amps are not exceeded. Take into account the service factor range if motor is nameplated above a 1.0 service factor.
5. Fan RPM should be checked and verified with a tachometer.

**NOTICE**

The fan was balanced at the factory to be within stringent vibration levels before shipment. However, there are several things that may cause vibration, such as rough handling in shipment and installation, weak foundations and alignments.

## Maintenance

1. Before performing any maintenance on the fan, be sure power is turned off and locked in the OFF position at the service entrance.
2. Ventilators should be carefully checked at least once a year. For critical or rugged applications, a routine check every two or three months is suggested.
3. All motors supplied with Twin City Fan & Blower ventilators carry a one-year limited warranty from date of shipment. For repairs within the warranty period, the motor must be taken to the motor manufacturer’s authorized service dealer. Contact your representative for additional warranty details.
4. A periodic motor check should consist of spinning the motor shaft with the power off to be sure the motor turns freely and the bearings run smoothly.
5. The belt on belt driven units should be removed from the motor sheave.
6. When removing or installing a belt, do not force the belt over the sheave. Loosen the motor mount so that the belt can be easily slipped over the sheave.
7. The belt on belt driven units should be removed and carefully checked for glazing, cracks, ply separation or irregular wear. A small irregularity in the contact surface of the belt will result in noisy operation. If any of these defects are apparent, the belt should be replaced. Check the sheaves also for chipping, dents or rough surfaces which could damage the belt.
8. The correct belt tension is important. Too tight of a belt will result in excess bearing pressure on the
motor bearings and shaft pillow blocks and may also overload the motor. Too loose of a belt will result in slippage which will quickly ‘burn’ out belts. A belt should feel “live” when thumped, approximately ¼" belt deflection (3 to 5 lb.) when subject to finger pressure at midpoint between sheaves.

8. The belt alignment should also be checked to be sure the belt is running perpendicularly to the rotating shafts. Fan and motor shafts must be parallel. Improper alignment will result in excessive belt wear.

9. Check sheave setscrews to ensure tightness. Proper keys must be in keyways.

10. Do not readjust blade pitch or fan RPM. If sheaves are replaced, use only sheaves of identical size and type.

11. If unit is to be left idle for an extended period, it is recommended that belts be removed and stored in a cool, dry place to avoid premature belt failure.

12. The standard pillow block bearings on belt driven ventilators are factory lubricated and are provided with external grease fittings. Annual relubrication is recommended, or more frequently if needed (see Table 2).

Do not over-grease. Use only 2 or 3 shots of a recommended lubricant with a hand gun in most cases (see Table 3). Maximum hand gun rating 40 P.S.I. Rotate bearings during lubrication where good safety practice permits.

**CAUTION**

Greases of different soap bases (lithium, sodium, etc.) may not be compatible when mixed. Prevent such intermixing by completely purging the bearing of old greases.

The most frequent causes of bearing failure are not greasing often enough, using an excessive quantity of grease, or using incompatible greases. Excessive vibration, especially if the bearing is not rotating, will also cause bearings to fail. Bearings must also be protected from water and moisture to avoid internal corrosion.

13. During the first few months of operation it is recommended that the bearing setscrews be checked periodically to ensure that they are tight.

14. The rotating wheel or propeller requires particular attention since materials in the air being handled can build up on the blades to cause destructive vibration or weaken the structure of the propeller by corroding and/or eroding the blade metal. Regular inspection and corrective action at intervals determined by the severity of each application are essential to good service life and safety.

Bearing Replacement

Fan bearings on belt driven fans should not need to be replaced for many years if the previous recommendations are strictly adhered to. However, use the following procedure when bearing replacement is necessary.

1. Gain access to the fan bearings. Remove the bearing cover, if any.

2. Loosen the belts by shifting the motor.

3. Remove the propeller or wheel and disconnect the remote lube lines (if applicable).

4. Measure the location of the bearing to the propeller or wheel end of the shaft and the bearing spacing.

5. Remove the shaft and bearing assembly. Note the position of the bearings’ shims (if applicable).

6. Loosen all bearing/shaft setscrews or other locking devices.

7. Remove bearings (may need to be pressed off the shaft).

8. Polish the shaft with fine emery paper (240 grit or finer) and file the setscrew dimples left on the shaft flat.

9. Install new bearings on the shaft, making sure that the collars are together (i.e. facing each other on the shaft). Lightly seat one setscrew or eccentric locking collar on each bearing to hold in the approximate marked position.

10. Mount the shaft/bearing assembly in the fan with bolts. Do not tighten yet. Just snug up. Loosen the setscrew.

11. Center the shaft in the housing (both ends) as closely as possible. (The fan propeller or wheel may need to be temporarily installed to get its clearances equal.)

12. Lubricate bearings. See Table 3 above.

13. Tighten setscrews in steps (alternating half turns). Note torquing requirements with bearing instructions.

14. Tighten the bearing mounting bolts.

15. Reinstall the lube lines (if applicable).

16. Install bearing cover, propeller and belts and adjust the motor to get proper belt tension. Also, make sure that the sheaves are properly aligned.

17. If a new shaft is supplied, ignore items 6 thru 8.
V-Belts

V-belts on these belt driven fans are oil, heat, and static resistant type and oversized for continuous duty. With proper installation and maintenance, years of operating efficiency can be added to the lifespan of the V-belt drive.

The condition of V-belts and the amount of belt tension should be checked prior to start-up (see Figure 1). When it becomes necessary to adjust belt tension, do not over-tension as bearing damage will occur. Recommended belt tension should permit \( \frac{3}{64}\)" deflection per inch of span of the belt at the center of the belt span. To find this point, measure halfway between the pulley centerlines as shown in Figure 2. Extreme care must be exercised when adjusting V-belts as not to misalign the pulleys. Any misalignment will cause a sharp reduction in belt life and will also produce squeaky, annoying noises (see Figure 3). On units equipped with 2 groove pulleys, adjustments must be made so that there is equal tension on all belts (see Figure 5).

**WARNING**

When removing or installing belts, never force belts over pulleys without loosening the motor first to relieve belt tension.

1. Where tensioning rods are not available, adjustment is more easily obtained by loosening and adjusting one side of the motor bracket at a time.

2. Always loosen tension adjustment enough to place belts on sheaves without running belts over the edge of either sheave. A new belt may be seriously damaged internally by careless handling (see Figure 4).

3. Fan speed can be increased by closing the adjustable motor pulley, or decreased by opening it. Two and three groove adjustable pitch pulleys must be adjusted an equal number of turns. (See Figure 5). Always check load on motor when increasing fan speed.

---

**Figure 1. Eliminate Slack**

Slack belts wear excessively, cause slippage and deliver less power. For longest belt life, always provide proper tension.

**Figure 2. Belt Deflection**

\[ \text{Deflection} = \frac{\text{Belt Span}}{64} \]

**Figure 3. Alignment**

Mount belts straight. Shafts must be parallel and sheaves in alignment to prevent unnecessary belt wear.

**Figure 4. Belts**

Do not force belt. Forcing the belt will break the cords and cause belt failure.

**Figure 5. 2-Groove Sheaves**

Two-groove variable pitch sheaves must be opened the same number of turns on both sides; otherwise, slippage occurs, wearing belts rapidly.
Motors

Twin City Fan & Blower recommends periodic checks of voltage, frequency and current of a motor while in operation. Such checks assure the correctness of frequency and voltage applied to the motor, and yield an indication of the fan load. Comparison of this data with previous data will give an indication of the fan performance. Any serious deviations could indicate a potential motor failure.

All motors have prelubricated sealed bearings and are lubricated for the life of the motor.

1. All motors carry a one-year limited warranty from date of shipment. For repairs within the warranty period, the motor must be taken to the motor manufacturer’s authorized service dealer. Contact your representative for additional warranty details.

2. A periodic motor check should consist of spinning the motor shaft with the power off to be sure the motor turns freely and the bearings run smoothly. The belt on belt driven units should be removed from the motor pulley.

Repair or replacement of motors is normally performed by a repair station authorized by the manufacturer. Contact your representative or the factory for locations nearest you. DO NOT ship motor to the factory without specific authorization forms.

Limitation of Warranties and Claims

Seller warrants to the original purchaser that the goods sold hereunder shall be free from defects in workmanship and material under normal use and service (except in those cases where the materials are supplied by the buyer) for a period of one year from the date of original installation or eighteen (18) months from the date of shipment, whichever occurs first. The liability of seller under this warranty is limited to replacing, repairing, or issuing credit (at cost, F.O.B. factory and at seller’s discretion) for any part or parts which are returned by buyer during such period provided that:

a. seller is notified in writing within ten (10) days following discovery of such defects by buyer, or within ten (10) days after such defects should reasonably have been discovered, whichever is less;

b. the defective unit is returned to seller, transportation charges prepaid by buyer;

c. payment in full has been received by seller for said products;

d. seller’s examination of such unit shall disclose to its satisfaction that such defects have not been caused by misuse, neglect, improper installation, repair, alteration, act of God, or accident.

No warranty made hereunder shall extend to any seller product whose serial number is altered, effaced or removed. Seller makes no warranty, express or implied, with respect to motors, switches, controls, or other components of seller’s product, where such components are warranted separately by their respective manufacturers. THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, WHETHER STATUTORY OR OTHERWISE, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. In no event shall seller be liable to buyer for indirect, incidental collateral, or consequential damages of any kind.

(BUYER’S FAILURE TO PAY THE FULL AMOUNT DUE WITHIN SIXTY (60) DAYS OF DATE OF INVOICE SHALL OPERATE TO RELEASE SELLER FROM ANY AND ALL LIABILITY OR OBLIGATION ARISING PURSUANT TO ANY WARRANTY, EXPRESS OR IMPLIED, WHETHER STATUTORY OR OTHERWISE, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, MADE IN CONNECTION WITH ANY CONTRACT FORMED HEREUNDER. BUYER AGREES THAT SUCH FAILURE TO PAY SHALL CONSTITUTE A VOLUNTARY WAIVER OF ANY AND ALL SUCH WARRANTIES ARISING PURSUANT TO SUCH CONTACT.)
